

## August 03 - Tuning Results and Recommendations

Larry McMillin, Sisong Zhou

Climate Research and Applications Division  
National Environmental Satellite, Data, and  
Information Service  
Washington, D.C.

[Larry.McMillin@noaa.gov](mailto:Larry.McMillin@noaa.gov)

## Procedures

- The following slides are based on a selection of regions screened for minimal cloud effects
  - Screened for small local variance
  - Smallest spot sample is collected
  - For each spot in the smallest sample, the closest match is found in the remaining samples based on the EMC profiles
  - Result is all spots with the same sample size and similar profiles
- Measured values are compared to ECMWF with the upper atmosphere blended with a regression retrieval based on AIRS data
- These data have the JPL angle adjustment applied

## Slide Description

- The next 15 slides show the average measured temperatures for each channel as a function of the case
- The first five cases are the focus days over land (Sept. 9-02, Sept. 29-02 Nov. 11-02, March 1-03, March 20-03, and April 9-03).
- The next five cases are the same days over sea.
- These cases are available as agl files which can be viewed using a free software package available from the following address
- <http://h18009.www1.hp.com/fortran/aview/getviewer.html>

## Channel 1 spot 1 on the left

## Channel 2 spot 1 on the left

## Channel 3 spot 1 on the left

## Channel 4 spot 1 on the left

## Channel 5 spot 1 on the left

## Channel 6 spot 1 on the left

## Channel 7 spot 1 on the right

## Channel 8 spot 1 on the right

## Channel 9 spot 1 on the right

## Channel 10 spot 1 on the right

## Channel 11 spot 1 on the right

## Channel 12 spot 1 on the right

## Channel 13 spot 1 on the right

## Channel 14 spot 1 on the right

## Channel 15 spot 1 on the left

## Slide Description

- The next 15 slides show the measured minus calculated differences for each channel as a function of the case
- The first five cases are the focus days over land (Sept. 9-02, Sept. 29-02 Nov. 11-02, March 1-03, March 20-03, and April 9-03).
- The next five cases are the same days over sea.

Channel 1 (measured – calculated difference) spot 1 on the left

Channel 2 (measured – calculated difference) spot 1 on the left

Channel 3 (measured – calculated difference) spot 1 on the left

Channel 4 (measured – calculated difference) spot 1 on the right

Channel 5 (measured – calculated difference) spot 1 on the right

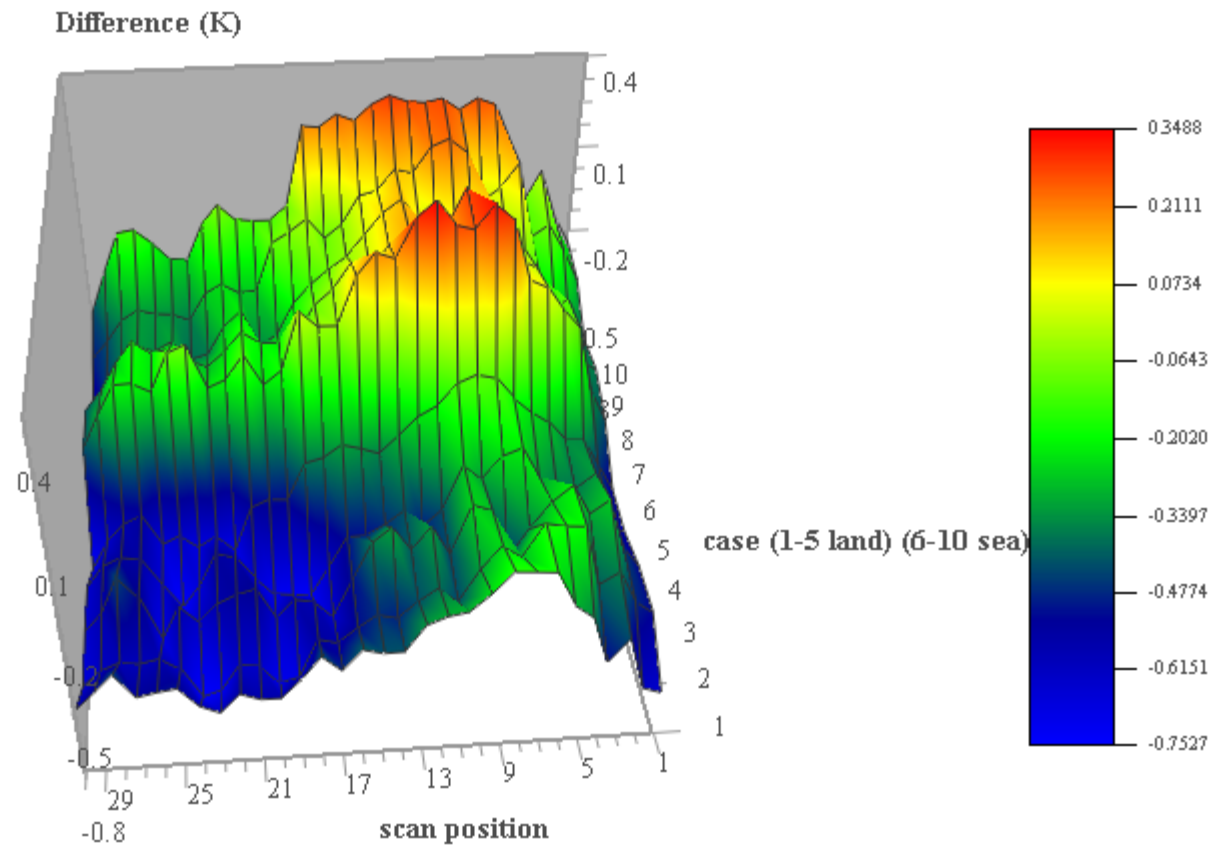

Channel 6 (measured – calculated difference) spot 1 on the right

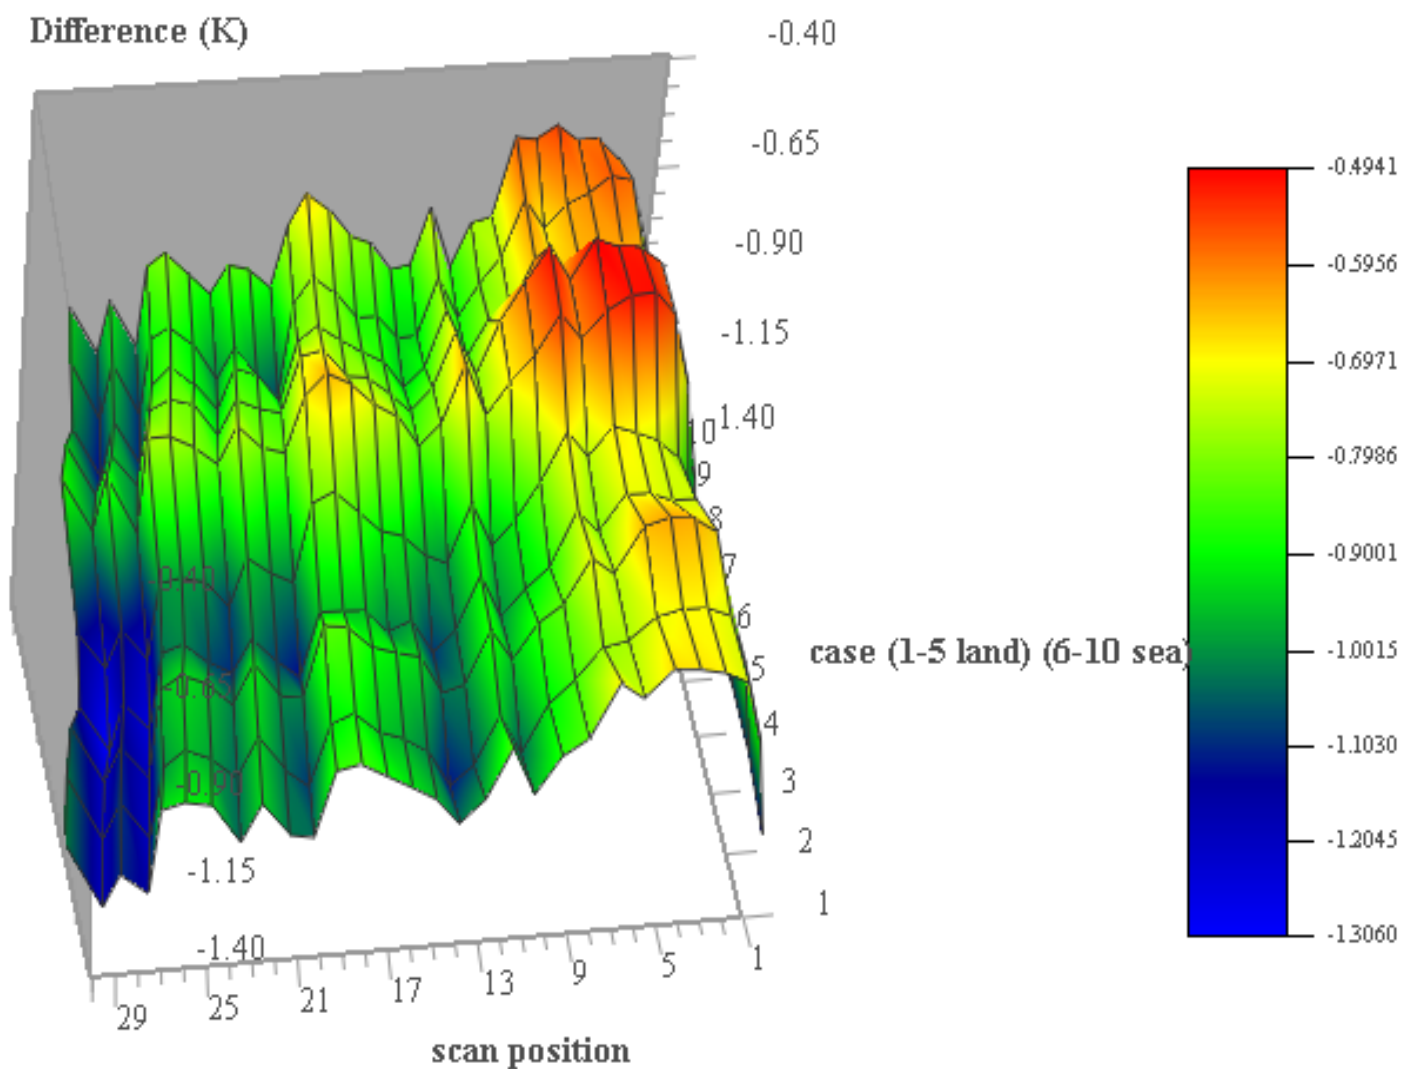

Channel 7 (measured – calculated difference) spot 1 on the right

Channel 8 (measured – calculated difference) spot 1 on the right

Channel 9 (measured – calculated difference) spot 1 on the right

Channel 10 (measured – calculated difference) spot 1 on the right

Channel 11 (measured – calculated difference) spot 1 on the right

Channel 12 (measured – calculated difference) spot 1 on the right

Channel 13 (measured – calculated difference) spot 1 on the right

Channel 14 (measured – calculated difference) spot 1 on the left

Channel 15 (measured – calculated difference) spot 1 on the left

## Slide Description

- The next 2 slides show typical locations for the comparisons

## Typical Land locations

## Typical Sea locations

## Slide Description

- The next 15 slides show the residual errors after the adjustments have been applied
  - Adjustment is the mean difference for the spot plus the 15 channel values plus the spot number plus the sin and cos of the latitude
- The first five cases are the focus days over land (Sept. 9-02, Sept. 29-02 Nov. 11-02, March 1-03, March 20-03, and April 9-03).
- The next five cases are the same days over sea.

## Channel 1 Residual Error (K)

## Channel 2 Residual Error (K)

## Channel 3 Residual Error (K)

## Channel 4 Residual Error (K)

## Channel 5 Residual Error (K)

## Channel 6 Residual Error (K)

## Channel 7 Residual Error (K)

## Channel 8 Residual Error (K)

## Channel 9 Residual Error (K)

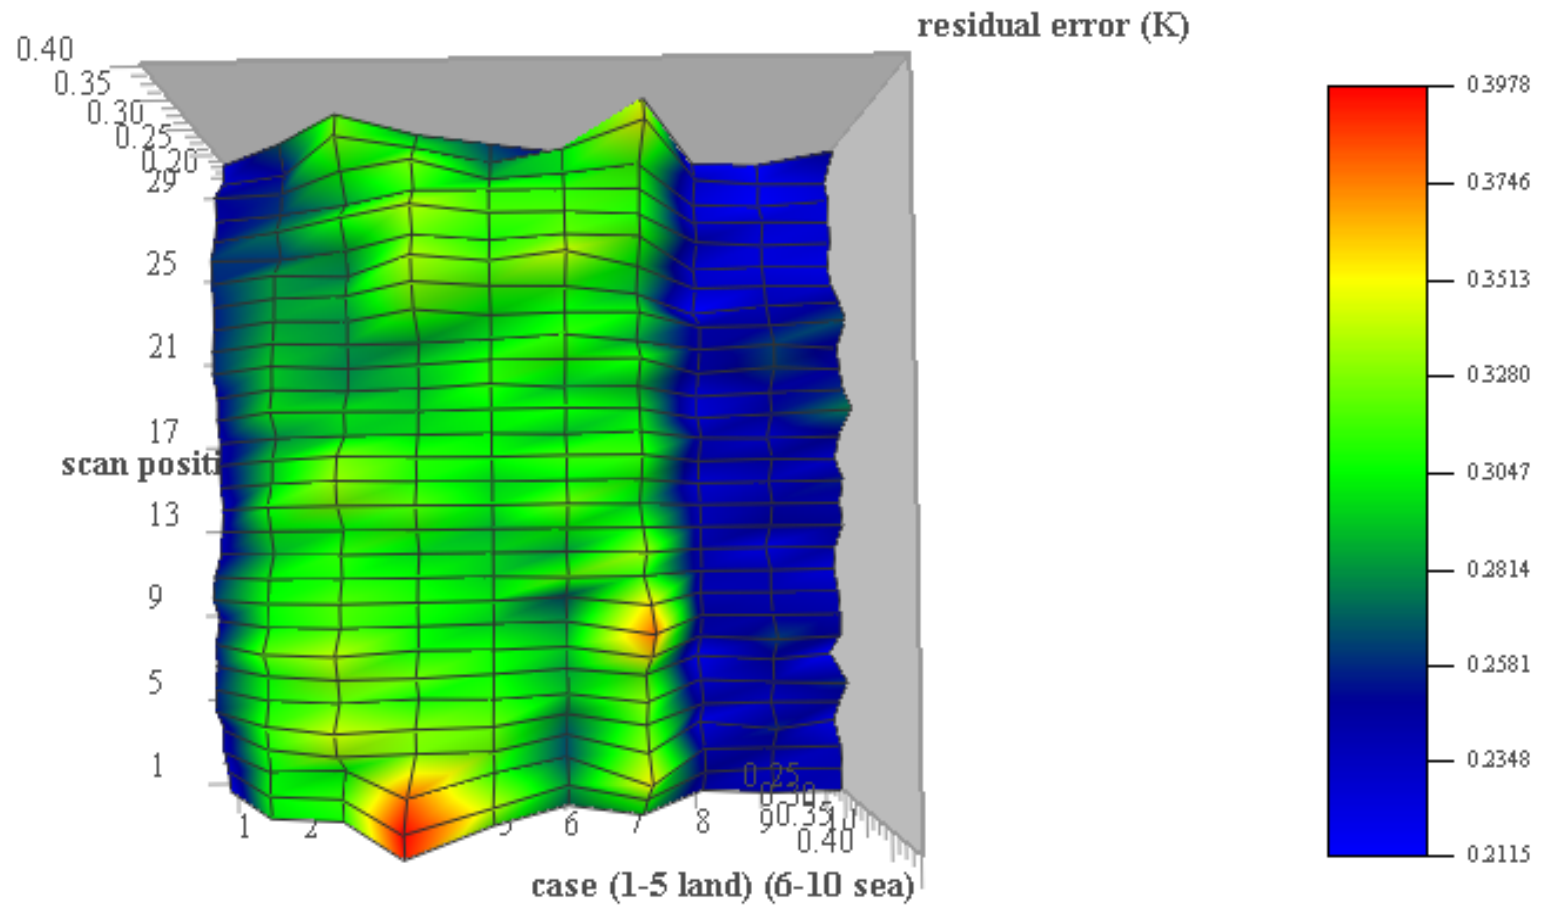

## Channel 10 Residual Error (K)

## Channel 11 Residual Error (K)

## Channel 12 Residual Error (K)

## Channel 13 Residual Error (K)

## Channel 14 Residual Error (K)

## Channel 15 Residual Error (K)

## Slide Description

- The next 15 slides show the residual errors after the adjustments for just the mean difference have been applied
  - Adjustment is just the mean difference for the spot p
- The first five cases are the focus days over land (Sept. 9-02, Sept. 29-02 Nov. 11-02, March 1-03, March 20-03, and April 9-03).
- The next five cases are the same days over sea.

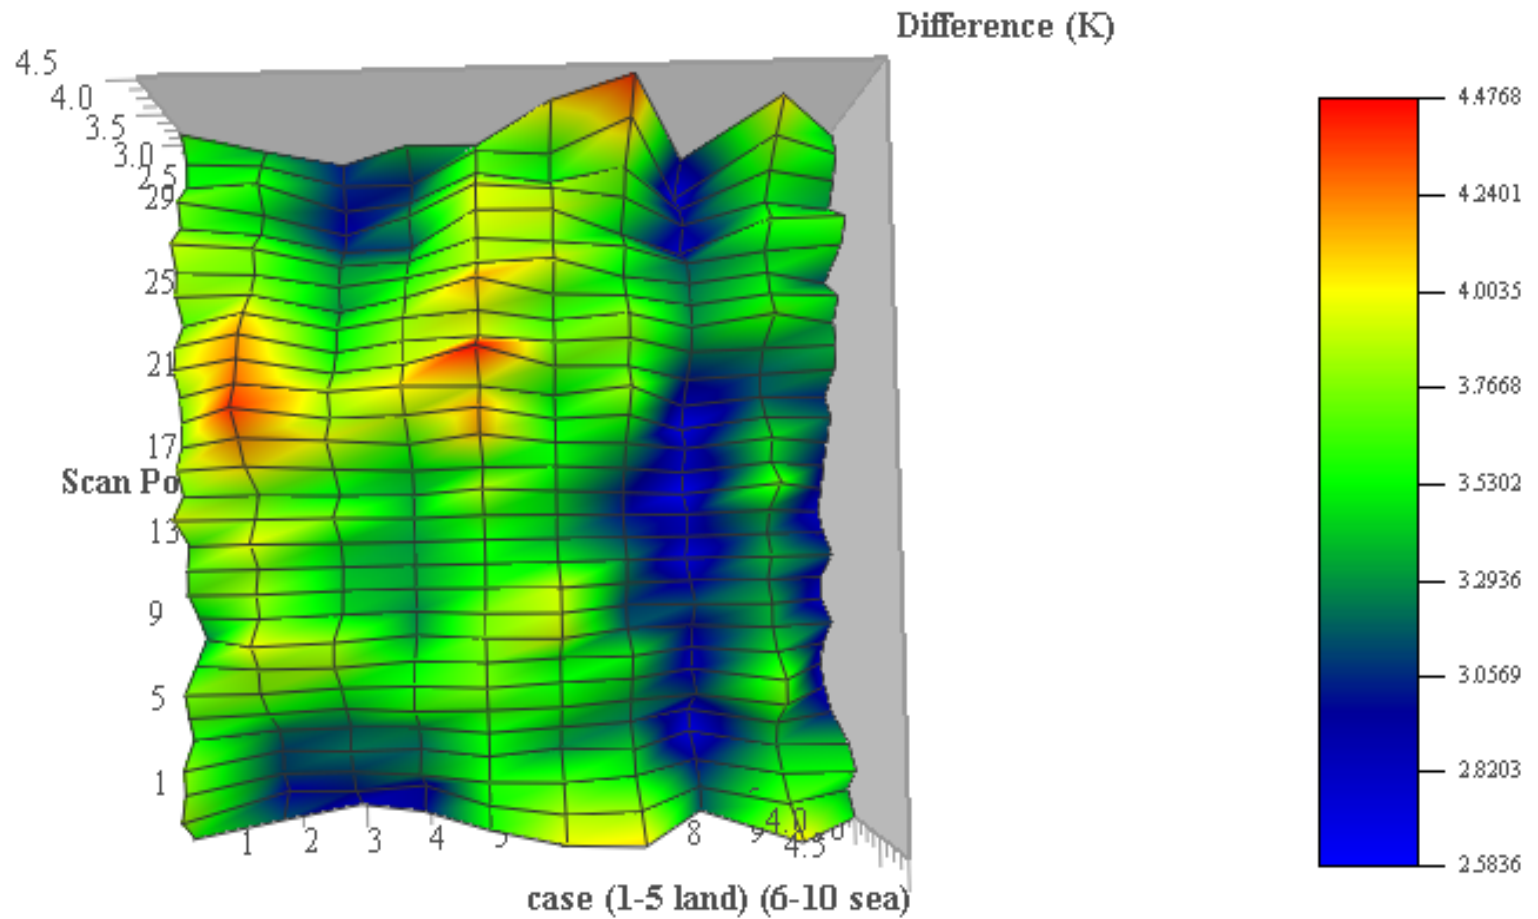

## Channel 1 bias only Residual Error (K)

## Channel 2 bias only Residual Error (K)

## Channel 3 bias only Residual Error (K)

## Channel 4 bias only Residual Error (K)

## Channel 5 bias only Residual Error (K)

## Channel 6 bias only Residual Error (K)

## Channel 7 bias only Residual Error (K)

## Channel 8 bias only Residual Error (K)

## Channel 9 bias only Residual Error (K)

## Channel 10 bias only Residual Error (K)

## Channel 11 bias only Residual Error (K)

## Channel 12 bias only Residual Error (K)

## Channel 13 bias only Residual Error (K)

## Channel 14 bias only Residual Error (K)

## Channel 15 bias only Residual Error (K)

## Regression coefficients

- The next slide shows the regression coefficients
- Note the strong diagonal dominance
- Part of this is a noise reducing pattern where the channel and its neighbors come in with different signs and add to about 1.0
  - This implies that the noise is correlated - if uncorrelated, the signs would not be opposite

## Regression coefficients for shrinkage regression

## Slide Description

- The next 3 slides show the error patterns
- There seems to be a tendency for the error to be correlated with the channel temperature.
  - Channel 1 over water is a noticeable exception

## Bias as a function of Temperature (All channels and cases)

The isolated cluster on the left is channel 1 over sea

## Temperature as a Function of Channel

## Bias as a Function of Channel

## Adjustment Evaluation

- The next 15 slides show the bias with and without the adjustment
  - Bt is the brightness temperature with the JPL adjustments applied
    - 1-5 for land and 10 – 15 for sea
  - At is the antennae temperature with no adjustments
    - 6-10 for land and 16 – 20 for sea

## Channel 1 Difference

## Channel 2 Difference

## Channel 3 Difference

## Channel 4 Difference

## Channel 5 Difference

## Channel 6 Difference

## Channel 7 Difference

## Channel 8 Difference

## Channel 9 difference

## Channel 10 Difference

## Channel 11 Difference

## Channel 12 difference

## Channel 13 Difference

## Channel 14 Difference

## Channel 15 Difference

## Adjustment Evaluation

- The next 15 slides show the residual errors after applying the bias correction with and without the JPL adjustment
  - Bt is the brightness temperature with the JPL adjustments applied
    - 1-5 for land and 10 – 15 for sea
  - At is the antennae temperature with no adjustments
    - 6-10 for land and 16 – 20 for sea

## Channel 1 residuals

## Channel 2 Residuals

## Channel 3 Residuals

## Channel 4 Residuals

## Channel 5 Residuals

## Channel 6 Residuals

## Channel 7 Residuals

## Channel 8 Residuals

## Channel 9 Residuals

## Channel 10 Residuals

## Channel 11 Residuals

## Channel 12 Residuals

## Channel 13 Residuals

## Channel 14 Residuals

## Channel 15 Residuals

## Conclusions

- The current bias adjustment makes some cases better and some worse. Overall it may be slightly better to skip it, but the difference is mixed and extremely subtle.

## Oct. 21 AIRS Meeting - AIRS Tuning Results

Larry McMillin, Sisong Zhou

Climate Research and Applications Division  
National Environmental Satellite, Data, and  
Information Service  
Washington, D.C.

[Larry.McMillin@noaa.gov](mailto:Larry.McMillin@noaa.gov)

## AIRS Bias Adjustments

- Data are screened for uniformity to select clear areas
- Constraint is tighter at the edge due to limb effects
- The smallest spot is selected
- Each spot in the smallest sample is matched with its closest match in each of other spot samples
- This gives the same number of spots in each sample and tends to minimize sample differences between spots

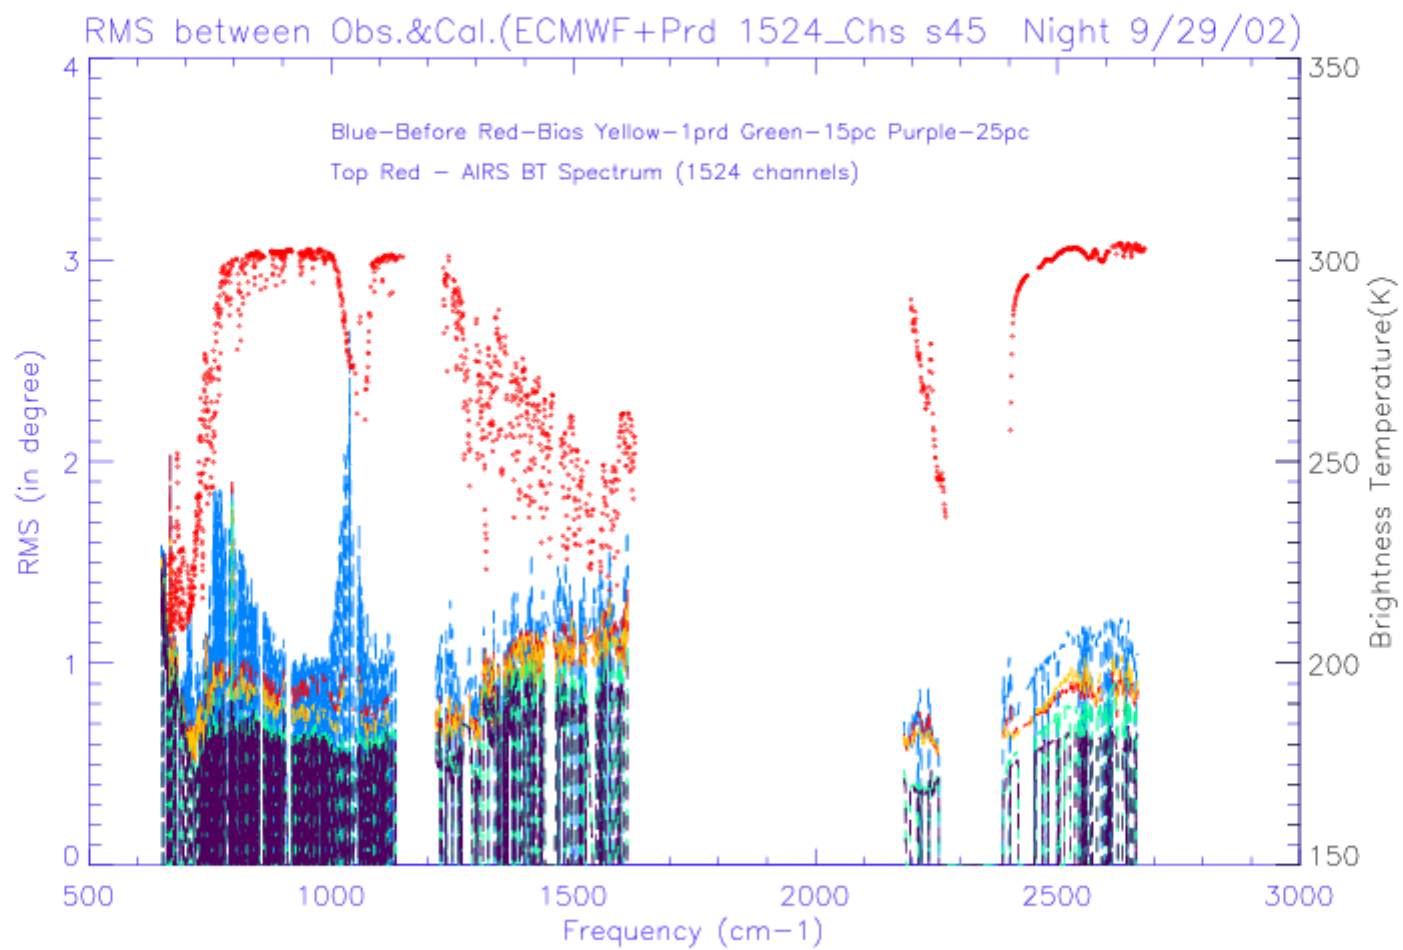

## Conclusions

- Biases are small
- Some channels show a slight left to right bias
- Some channels show scan effects
- Upper channels tend to be warm relative to ECMWF
- Lower channels tend to be cold relative to ECMWF
- Short wavelength channels show solar heating

## Next slides

- The next two slides show the effect of bias corrections for night and day
- The upper red curve is a typical spectrum for reference
- The blue shows the improvement due to just a bias correction
- The red shows the additional effect of a bias correction plus the channel being predicted
- The yellow shows additional improvement due to 15 using principle component scores
- The cyan shows the improvement in temperature due to 25 principle component scores
- Note the second slide is radiance divided by the radiance at 290K

## Conclusions

- A large improvement is observed with just a bias adjustment
- A single channel predictor makes a significant additional improvement

## colors

- Color guide - the figures do not have legends
- dark blue ( 1 or 6)
- Green ( 2 or 7)
- Red ( 3 or 8)
- cyan (not red) ( 4 or 9)
- violet (not green) ( 5 or 10)
- yellow (not blue) ( 6 or 11)
- gold ( 7 or 12)
- medium blue ( 8 or 13)
- dark purple ( 9 or 14)
- yellow green ( 10 or 15)
